TECHNICAL FIELD

The present invention relates generally to Internet applications. In particular, the present invention relates to a system for tracking the use of a web tool.

BACKGROUND

Web servers with web tools are commonly made available to web users through the Internet. Web tools provide numerous variety of on-line services such as sales, auctions, information services, virtual forums, customer support, and expert assistance services. It is typically desirable for web tool providers to track web user's use of their services from one session to another. Usage metrics such as time of use and specifically requested web page(s) are commonly tracked. In some systems, web tool providers offer numerous web tools (e.g.,

search engines, forums, help desks) within the same general web site such as with a customer support site. One or more actual servers may be used for providing one or more of these multiple web tools. In such cases, it is also desirable to track metrics (or usage parameters) such as web tool application type and particularly utilized server or servers.

5 Conventional tracking schemes have involved documenting usage parameters for a web tool within the actual web tool server that is providing the web tool. Unfortunately, with organizational systems that provide multiple web tools through numerous servers, this can be inefficient and difficult to carry out. User information must be separately extracted (and/or mined) from each server. Not only does this consume excessive resources, but it also makes it difficult to compare data from one web tool (or application) to another, as well as from one server to another – even when providing the same web tool.

 Accordingly, it would be desirable to have an improved method and system for tracking the use of web tools, especially in systems that provide multiple web tools through multiple servers.

SUMMARY OF THE INVENTION

15 The present invention is directed to a web tool usage tracking method and system. One embodiment generally involves providing to a web user access to a web tool. In providing the web tool, one or more web page files, in connection with the user accessing the web tool, are transmitted to the web user. Within at least one of the web page files transmitted to the user, a command is inserted. The command has embedded user information that is associated with the web user's use of the web tool. The command causes the web user computer to transmit to a server that is designated within the command a request including the embedded user information. The designated server stores the user information in a database in response to the request being processed by the designated server.

20 A system for implementing a tracking scheme of the present invention is also provided. In one embodiment, the system includes a web tool server and a designated server. The web tool server is operably connected (or at least adapted to be operably connected) to one or more web user computers. The web tool server has a web tool program for providing to each web user computer one or more web page files for a web tool session. The web tool

server inserts within at least one of the one or more web page files, associated with the session, a command having embedded user information associated with a web user's use of the web tool. The designated server is operably connected (or at least adapted to be operably connected) to the one or more web user computers. When a user computer executes the command, it transmits to the designated server a request that includes the embedded user information. The designated server then transfers the user information to a database in response to processing the request.

The foregoing has outlined rather broadly the features of the present invention in order that the detailed description of the invention that follows may be better understood. Additional features of the invention will be described hereinafter which form the subject of the claims of the invention. It should be appreciated by those skilled in the art that the conception and specific embodiment disclosed may be readily utilized as a basis for modifying or designing other structures for carrying out the same purposes of the present invention. It should also be realized by those skilled in the art that such equivalent constructions do not depart from the spirit and scope of the invention as set forth in the appended claims.

BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding of the present invention, reference is now made to the following descriptions taken in conjunction with the accompanying drawing, in which:

FIGURE 1 shows a block diagram of one embodiment of a broken image tracking ("BIT") system of the present invention;

FIGURES 2A and 2B show an exemplary web page that incorporates a BIT tag of the present invention;

FIGURE 2C shows a portion of the source file with a BIT tag for the web page depicted in FIGURES 2A AND 2B;

FIGURE 3 shows in greater detail the exemplary BIT tag of FIGURES 2A-2C;

FIGURE 4 depicts an exemplary error log from one embodiment of a BIT scheme of the present invention;

FIGURE 5 shows a block diagram of an alternative embodiment of a BIT system of the present invention; and

FIGURE 6 shows one embodiment of a routine for implementing a BIT module within a BIT server of the present invention.

DETAILED DESCRIPTION

The present invention provides and employs the use of Broken Image Tracking ("BIT") for tracking user information for users of a web site or web tool. With BIT, the web page generating program (e.g., a web tool program) inserts a "broken image" tag in various (or even all) of the web pages transmitted to a user. In general, a BIT tag is a HTML image tag (or equivalent) with a BIT URL, i.e., a URL that includes embedded user information and a broken image file designator. As used herein, a broken image file is a file that cannot be located, e.g., because it does not exist or because its directory path does not point to it. The BIT URL has a file path that directs the user's image-retrieving browser to an information gathering ("broken image") web server. With the designated broken image file in the URL, the broken image server will attempt but will not be able to find and retrieve to the browser the broken image file. This causes the server to log (in its error log) the BIT URL, which includes the user information. In this way, user information can be collected and routed into a centralized repository such as the error log within the broken image server. This can be extremely convenient – especially when relevant user information for a given web tool is being collected for users accessing the web tool through multiple implementations and/or instantiations of the web tool such as when a web tool is being implemented through various servers.

FIGURE 1 shows one embodiment of a portion of an organization's web site system 110 of the present invention. Web site system 110 is connected to multiple web user computers 120 through the portion of the Internet 105 known as the World Wide Web (the Web). In the depicted embodiment, web site system 110 generally includes web tool servers 112A-112C, broken image server 116, and web tool database server 118. Each web tool server, 112A through 112C, is operably connected to the web tool database 118 and includes a corresponding web tool (with BIT insertion) program 113A, 113B, or 113C, respectively.

Each web tool server 113 also includes an Internet (or Internet enabling) program 114. Likewise, the broken image server 116 includes an Internet program 114 having an error log 117 used for storing user information relating to web users use of the web tools 113A through 113C.

5 The Internet programs 114 enable the web tool and broken image server's 112, 116 to function as web servers. They may be implemented with any suitable Internet enabling software such as Apache, Microsoft IIS, and Netscape Enterprise Server. In the web tool servers 112, Internet programs 114 enable web tool servers 112 to function as web servers thereby providing web users 120 with access to the web tool programs 113. On the other hand, the primary purpose of the Internet program 114 in the broken image server 116 is to facilitate a centralized repository for receiving and storing BIT URLs in its error log 117. Conventional Internet enabling software, such as Apache, include error logging mechanisms, which will store the BIT URLs of the present invention in a self-generating error log.

10 Web tool programs 113A - 113C execute and provide to web users (via Internet programs 114) a web tool (or web site) for assisting or providing information to the user in relation to an organization's business or activities. In addition, the web tool programs 113 include a routine (or function) for inserting a BIT tag into the web page being transferred to a web user. Web tool information and forms generated by the web tool programs 113 are typically formatted in a hypertext mark-up language (HTML) and can include text, programs, 15 graphics, video, and audio portions. Any suitable programming scheme may be used for implementing a web tool program 113. In one embodiment, a Java servlet on a Windows NT platform is used for dynamically generating the web pages with web page templates. (As used herein, a servlet comprises a Java application that runs in a Web server or application server and provides server-side processing. Persons of skill will recognize, however, that acceptable 20 substitutions include but are not limited to CGI scripts, Active Server Pages (ASPs) and plug-ins written in C and C++ for specific Web servers, e.g., ISAPI, NSAPI.) With this scheme, servlet functions dynamically generate and insert a BIT tag into each web page provided to a web user from a web tool server 112.

Web tools could include but are not limited to keyword search engines, natural language search engines, user forums, case-based expert system help desks, or any web application used to implement a particular web site. In one embodiment, the web tool servers 112 are forum servers (i.e., forum server 1, forum server 2, and forum server 3) for providing customer web users with access to a user forum (message boards, etc.) relating to a company's product or products. An example of such a user forum may be found at Hewlett Packard's www.hp.com web site in its "Customer Care Center" where the "HP User Community Forum" may be accessed for communicating with other HP customers about HP products of interest. The three forum servers are redundantly used for implementing the user forum in order to provide load balancing and to increased reliability.

The web tool database server 118 is a conventional database server for storing and providing to the web tool servers 112 web tool information relating to the web tool being implemented on the web tool server 112. For example, with the web tool servers being user forum servers, the database server 118 would store posted questions, question responses and the like. Web tool database server 118 can be implemented with any suitable database scheme including but not limited to flat-file, hierarchical, relational, and object-oriented databases.

The web user computers 120 can be any form of Internet access device, including a computer or Internet appliance with an appropriately operable web browser. Likewise, the web tool servers 112, broken image server 116, and web tool database server 118 can be implemented with any suitable combination of one or more computers, including but not limited to mainframes, workstations, or personal computers, running operating systems such as Windows NT, UNIX, LINUX, or any other computer operating system. For example, a web site system may comprise one or more web tool or web site servers that perform a single or various web site tasks. These servers could be implemented on one or several computers. In addition, one or more broken image servers may be used, and they can be executed in any suitable web server including in a stand-alone web server (as is depicted) or even in one of the web tool servers.

10 In operation, a web user 120 initiates and engages in a session with the web tool in the organization web system 110. In doing so, it communicates with one or several of the servers 112A, 112B, or 112C. Within the session, the user transmits to a web tool server requests for receiving and viewing desired information. Upon receiving a request, the web tool server
5 through its executing web tool 113 generates and transmits to the user's browser a responsive web page file containing the desired information. In one embodiment of the invention, the web tool inserts into each transmitted web page file a BIT tag having a BIT URL with user metrics relating to the user's web session. Upon receiving the web page file, the user's browser executes the web page file in order – among other things – to display a
10 corresponding web page. In executing the web page file, the browser executes the BIT tag, which causes it to transmit the BIT URL to the broken image server 116 in attempting to retrieve therefrom the broken image file that is designated within the BIT URL. Upon receiving the BIT URL, the broken image server 116 attempts to locate and send back to the browser the designated broken image file. However, it will not be able to locate the file (e.g.,
15 because it doesn't exist), which causes its Internet program 114 to register an error and store in its error log 117 the BIT URL. Thus, BIT URLs associated with each web page in the session will be stored in the error log 117 of the broken image server 116. Accordingly, BIT URLs associated with all of the web pages generated by the web tool servers 112A, 112B, and 112C for all web users 120 can be stored in error log 117. In this way, user information
20 for all users using this (or any other web tool within the organization web system 110) is accumulated within the error log, which serves as a common, centralized database for storing the user information.

25 With reference to FIGURES 2A-2C and 3, an exemplary BIT tag in a forum web tool page will now be described. FIGURES 2A and 2B show an index web page from the "HP Network Printing Products" forum. The upper portion of the page is depicted in FIGURE 2A; while the lower portion is shown in FIGURE 2B. FIGURE 2C shows the end section of the HTML source code for the web page that is depicted in FIGURES 2A and 2B. The BIT tag for this web page is highlighted at 210. Even though this tag is an image tag, it is
30 configured so that the browser will not display an error graphic in response to the designated BIT image file failing to be returned to the browser. The blank region at 205 in FIGURE 2B

shows where such an graphic would otherwise appear. Thus, the use of BIT tags can effectively be transparent to a web user.

With reference to FIGURE 3, the BIT image tag 210 is shown with its constituent components separately highlighted. BIT tag 210 generally includes an image tag identifier 305, a display size segment 310, a BIT URL 320, and a format segment 340. The image tag identifier, "img" at 305, is a HTML instruction that identifies the tag as an image tag. It generally causes a browser to retrieve and display the graphic file specified in the BIT URL 320. The display size segment 310 defines the allowable space that the specified graphic can occupy. In the depicted embodiment, the height and width are each set to one. This corresponds to a one by one pixel array allotment for the graphic, which effectively ensures that an error graphic will not appear on the user's screen. This is desirable because the designated image is a broken image and thus an image error will occur, which would otherwise cause the browser to display an image error graphic.

The next segment is the BIT URL 320. BIT URL 320 comprises the "SRC" identifier 321, broken image server address 323, port identifier 325, broken directory segment 327, embedded user information segments 329 - 337, and a broken image file 339. The SRC identifier 321 indicates to the browser that the server, file path and file to be displayed will follow. The broken image server address 323 identifies to the browser the name and location of the broken image server. In the depicted embodiment, it is at "http://hpcc981.external.hp.com." The port identifier 325 indicates the port for the broken image server. However, it is not actually required for the broken image server to be identified. The next segment is the broken directory segment 327. It is an arbitrary directory name that is ensured not to contain a graphic. Like the port identifier 325, the broken directory segment 327 is not required for proper operation.

The embedded user information segments 329 through 337 include – in a directory path format – various segments of user information relating to a user session with a web tool server. The "appid=jforum" segment 329 is an application identification segment. The particular application in this embodiment is "jforum", which corresponds to the exemplary user forum web tool. In this way, BIT URLs for various applications (or web tools) can be

5 routed to, stored in, and separately retrieved from a common error log in a single broken image server. Of course, multiple broken image servers could also be readily used. The next segment 331 is the forum number segment, which in the depicted embodiment is "98." In the example, forum 98 corresponds to the network printing forum. In this example, there are over 150 separate forums – one for each product line that is available through the web site.

10 The next two segments, "forum" and "index_pl" (referenced together at 333) identify the specific web page file template transmitted to the user. Depending on where a user is at in the web tool (forum), these two segments will vary. For example, if a user were reading a message, it could be "forum/show." From segment 333, it can be seen that the user was in the index page, which corresponds to the forum web page of FIGURES 2A and 2B. It basically conveys what portion of the site the user is looking at in a particular instance of time. The 15 "///" at 335 is an empty field. If a user had actually read a message in this web page, the number of the message would be in this field. The "_kpq8Gfb" segment 337 is a unique session identifier. This identifier is randomly generated and assigned to a user for a given session. Each web page transmitted to the user for that session will include a BIT URL with the same session identifier.

20 The last segment in the depicted BIT URL is the bogus image file designator, "broken.gif," at 339. It ensures that the broken image server actually looks for an image file. In turn, this ensures that an image error will occur since no such file will be found. Thus, segment 339 is the name of a bogus image file that may or may not exist -- so long as it cannot be found if in fact it does exist. (It should be recognized, however, that a file need not necessarily be designated in the BIT URL – depending on the utilized internet programs for the web tool and broken image servers – in order to achieve proper BIT operation. That is, the BIT URL would not have to include the broken.gif segment 339 or any other file 25 designation.)

The format segment 340 is an html format instruction. In the depicted embodiment, "border = 0" tells the browser not to include a border. This is similar to the height and width dimensions each being set to one in the display size segment 310.

FIGURE 4 shows a portion of an exemplary error log. The depicted error log portion includes logged error messages, 401, 403, 405, and 407. Error messages 403 and 407 are broken image errors, and error messages 401 and 405 are conventional logged errors, which occurred within the natural course of operation in the broken image server. With reference to error message 401, each error message includes a time stamp section, an error indicator section, an affected client section, and an error type section. The time section indicates the date and time that the error was logged. The error indicator section conveys that an error was registered. The affected client section identifies the client for which the error occurred. Finally, the error type section conveys the type of error that was logged.

As seen in BIT error messages 403 and 407, when a BIT error is logged, the error type shows: "file does not exist." This is followed by the failed file path, which includes the embedded user information from the bit URL. In the depicted drawing, the user information is highlighted in italics. The "broken-images" segment serves as a preamble indicating the beginning of the user information.

In one embodiment, on a periodic basis (e.g. weekly), the error log can be mined for user information. A script or any other suitable program may be executed to look for user information within logged error messages. With the error log of FIGURE 4, the search engine could simply search for embedded phrases beginning with "broken-images" and ending with "broken.gif." These phrases could be retrieved from the error log, and their associated error messages would be deleted. The retrieved messages could then be stored in any suitable database for desired analysis. The user information phrases could be stored as individual records, with their sections being individually indexable. This way, user information phrases could be sorted based on desired relationships such as common users, common applications, or similar time ranges. Persons of ordinary skill will recognize, however, that the user information may be stored and used in any desired manner once it has been retrieved and stored in a central database. Alternatively, user information could also be initially retrieved based on desired grouping strategies from the error log itself.

FIGURE 5 shows one embodiment for implementing an alternative organization web system 510 of the present invention. Web system 510 generally includes web tool servers

112A-112C, web tool database server 118, broken image server 516, and a bit user
information database 518. Web tool servers 112A-112C, along with web tool database server
118, function similarly to those previously described and depicted in FIGURE 1. Broken
image server 516, however, additionally includes BIT module 519, along with Internet
5 program 114, which includes error log 117.

BIT module 519 is a program for identifying BIT error messages and routing their
contained user information directly to BIT user information database 518 rather than storing
them in error log 117. This provides two primary benefits. First, it enables user information
to be automatically stored in the BIT user information database 518 as the BIT URLs are
coming into the BIT information server 516. This enables the user information to be more
conveniently and efficiently accessible on a real-time basis. Second, by not storing BIT
10 URLs in the error log 517, it makes it easier for legitimate error messages to be processed
from the error log, which is not cluttered with BIT error messages.

FIGURE 6 shows one embodiment of a routine 600 for generally implementing a BIT
module program. Within Internet program 114, when an error message is generated at step
602, the routine determines at 604 whether the error message is a BIT error message. If it is
not, the error message is written to the error log 117 at step 606. On the other hand, if the
error message is in fact a BIT error message, then its user information is extracted and
conveyed to the BIT user information database at step 608. BIT module 519 may be
15 implemented with any suitable programming scheme. As shown in the depicted embodiment,
it is a module within (or on top of) Internet program 114. For example, if Internet program
114 is an Apache program, then BIT module 519 could be carried out with a Pearl script
executing in cooperation with the Apache Internet enabling engine. However, persons of
skill will recognize that any suitable programming scheme will suffice.

20 The BIT user information database 518 may be implemented with any suitable
database scheme. For example, it may be implemented with an Oracle SQL-type database
program. In this way, conventional SQL functions (e.g., update) could be incorporated into
the BIT module 519 for updating database 518. In addition, reports could be readily
generated in response to a desired query. Moreover, the BIT user information database 518
25

could store the user information according to any desired scheme. Information sections could be grouped based on timing, user session IDs, applications, or any other desired categorizations.

Although the present invention and its advantages have been described in detail, it should be understood that various changes, substitutions and alterations can be made herein without departing from the spirit and scope of the invention as defined by the appended claims. Moreover, the scope of the present application is not intended to be limited to the particular embodiments of the process, machine, manufacture, composition of matter, means, methods and steps described in the specification. As one of ordinary skill in the art will readily appreciate from the disclosure of the present invention, processes, machines, manufacture, compositions of matter, means, methods, or steps, presently existing or later to be developed that perform substantially the same function or achieve substantially the same result as the corresponding embodiments described herein may be utilized according to the present invention. Accordingly, the appended claims are intended to include within their scope such processes, machines, manufacture, compositions of matter, means, methods, or steps.

WHAT IS CLAIMED IS:

- 1 1. A method for tracking the use of a web tool by a web user, comprising:
2 providing a web user through a web user computer access to a web tool;
3 transmitting to the web user computer one or more web page files in connection with
4 the user accessing the web tool; and
5 inserting within at least one of the web page files a command having embedded user
6 information associated with the web user's use of the web tool, the command causing the web
7 user computer to transmit to a server, designated within the command, a request that includes
8 the embedded user information, wherein the user information is stored in a database in
9 response to the request being processed by the designated server.
- 1 2. The method of claim 1 wherein the command comprises a mark up language
2 image tag.
- 1 3. The method of claim 2 wherein the command includes a BIT tag with the user
2 information embedded in a BIT URL.
- 1 4. The method of claim 1 wherein the web tool is provided to a plurality of web
2 users with each user receiving at least one web page having a command with embedded user
3 information, wherein the user information for each user is transmitted to the designated
4 server.
- 1 5. The method of claim 1 wherein the user information is stored in an error log
2 within the designated server.
- 1 6. The method of claim 1 wherein the request is a request for retrieving an image
2 file from the designated server, which has an Internet program with an error log, wherein the
3 Internet program stores the user information in the error log in response to an error being
4 generated by the server not finding the file that is to be retrieved.

1 7. The method of claim 1 wherein the request is a request for retrieving an image
2 file from the designated server, which has an Internet program with an error log, wherein the
3 processed request generates an error when the image file is not found by the server, the
4 method further comprising identifying the request in response to the generated error and
5 storing the user information in a database that is separate from the error log.

1 8. The method of claim 1 wherein the act of inserting includes inserting the
2 command in the at least one web page file so that it causes substantially no error graphic to be
3 displayed to the user in response to an image file designated within the command not being
4 retrieved.

1 9. A system for tracking web users use of a web tool, comprising:
2 a web tool server configured to be operably connected to one or more web user
3 computers, the web tool server having a web tool program for providing to each web user
4 computer one or more web page files in a web tool session, the web tool server inserting
5 within at least one of the web page files associated with the session a command having
6 embedded user information associated with a web user's use of the web tool; and
7 a designated server configured to be operably connected to the one or more web user
8 computers, wherein the command when executed by a web user computer causes the web
9 user computer to transmit to the designated server a request that includes the embedded user
10 information, wherein the user information is stored in a database in response to the request
11 being processed by the designated server.

1 10. The system of claim 9 wherein the database is an error log within the
2 designated server.

1 11. The system of claim 10 wherein the designated server includes an Internet
2 program for implementing the designated server as a web server, wherein the Internet
3 program stores user information from a request into the error log in response to an error being
4 generated by the request at the designated server.

1 12. The system of claim 11 wherein the request includes a BIT URL with a
2 designated broken image file that cannot be found within the designated server, which causes
3 the error to be generated by the Internet program.

1 13. The system of claim 9 wherein the designated server includes an Internet
2 program for implementing a web server with an error log, wherein the user information is
3 stored in the database separate from the error log.

1 14. The system of claim 13 wherein the Internet program includes a BIT module
2 for storing the user information in the database rather than the error log.

1 15. The system of claim 9 wherein the command includes a BIT tag that is
2 implemented with a mark-up language tag.

1 16. The system of claim 15 wherein the mark up language tag is an HTML image
2 tag.

1 17. The system of claim 9 wherein the Web tool server and designated server are
2 implemented in the same computer.

1 18. A web tool system having the capability of tracking a user's use of a web tool,
2 comprising:

3 a web tool server communicatively linked to a web user computer for providing a web
4 user with access to a web tool, the web tool server having a web tool program for generating
5 and providing to the web user computer one or more web page files in connection with the
6 web user engaging in a session with the web tool;

7 a designated server communicatively linked to the web user computer, the designated
8 server including a web server with an error log; and

9 a user information database server communicatively linked to the designated server,
10 wherein the web tool program inserts into at least one of the one or more web tool pages for a
11 web user session, a command having embedded user information associated with the web
12 user's use of the web tool, the command causing the web user computer to transmit to the
13 designated server a request that includes the embedded user information, wherein the
14 designated server transfers the user information from the request to the user information
15 database in response to processing the received request.

1 19. The system of claim 18 wherein the request causes the designated server to
2 generate a broken image error, the designated server including a module for transferring the
3 user information into the user information database rather than the error log in response to
4 detecting the generated broken image error.

1 20. The system of claim 18 wherein the command is a BIT tag that includes a BIT
2 URL with a broken image file designation.

1 21. A computer program product for tracking the use of a web tool by a web user,
2 the product having computer readable instructions thereon that when executed cause a
3 computer to perform the following acts:

4 providing a web user through a web user computer access to a web tool;

5 transmitting to the web user computer one or more web page files in connection with
6 the user accessing the web tool; and

7 inserting within at least one of the web page files a command having embedded user
8 information associated with the web user's use of the web tool, the command causing the web
9 user computer to transmit to a server, designated within the command, a request that includes
10 the embedded user information, wherein the user information is stored in a database in
11 response to the request being processed by the designated server.

0968794-10400

ABSTRACT OF THE DISCLOSURE

The present invention provides a web tool usage tracking method and system. One embodiment generally involves providing to a web user access to a web tool. In providing the web tool, one or more web page files, in connection with the user accessing the web tool, are transmitted to the web user. Within at least one of the web page files transmitted to the user, a command is inserted. The command has embedded user information that is associated with the web user's use of the web tool. The command causes the web user computer to transmit to a server that is designated within the command a request including the embedded user information. The designated server stores the user information in a database in response to the request being processed by the designated server.

**DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION**
ATTORNEY DOCKET NO. 10002096-1

As a below named inventor, I hereby declare that:

My residence/post office address and citizenship are as stated below next to my name;

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

Broken Image Tracking

the specification of which is attached hereto unless the following box is checked:

() was filed on _____ as US Application Serial No. or PCT International Application Number _____ and was amended on _____ (if applicable).

I hereby state that I have reviewed and understood the contents of the above-identified specification, including the claims, as amended by any amendment(s) referred to above. I acknowledge the duty to disclose all information which is material to patentability as defined in 37 CFR 1.56.

Foreign Application(s) and/or Claim of Foreign Priority

I hereby claim foreign priority benefits under Title 35, United States Code Section 119 of any foreign application(s) for patent or inventor(s) certificate listed below and have also identified below any foreign application for patent or inventor(s) certificate having a filing date before that of the application on which priority is claimed:

COUNTRY	APPLICATION NUMBER	DATE FILED	PRIORITY CLAIMED UNDER 35 U.S.C. 119
			YES: _____ NO: _____
			YES: _____ NO: _____

Provisional Application

I hereby claim the benefit under Title 35, United States Code Section 119(e) of any United States provisional application(s) listed below:

APPLICATION SERIAL NUMBER	FILING DATE

U. S. Priority Claim

I hereby claim the benefit under Title 35, United States Code, Section 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code Section 112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, Section 1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

APPLICATION SERIAL NUMBER	FILING DATE	STATUS (patented/pending/abandoned)

POWER OF ATTORNEY:

As a named inventor, I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and transact all business in the Patent and Trademark Office connected therewith:
